

# Electric performance of new non-SF<sub>6</sub> gases and gas mixtures for gas-insulated systems

Presented by Karsten Juhre & Michael Walter on behalf of WG D1.67 (convenor: Christian Franck)

Paris - 1.9.2022

### **Table of contents**

- Introduction
- Overview Working Group Activities
- Part A: State-of-the-Art Summaries
- Part B: Newly proposed test methods and procedures
- Part C: Electrical Insulation Strength of novel gas mixtures
- Part D: Gas Mixture Analysis
- Summary and Conclusion

### **Working Group Scope**

- Describe methods for identifying new insulating gases and gas mixtures.
- Investigate and summarize the dielectric properties and
- the practical insulation performance of new non-SF<sub>6</sub> insulating gases and gas mixtures for gas-insulated systems.
   [Terms of Reference, 18/08/2016]

# Part A

#### **State-of-the-Art Summaries**

[Status of 2019]

### Typical SF<sub>6</sub> use conditions in MV and HV electrical equipment

	Туре	Voltage range	Typical operating pressure of SF <sub>6</sub> (relative)	temperature range	Mass of SF <sub>6</sub> (order of magnitude)
MV	Ring main unit (RMU) / GIS	3.6-52 kV	Mainly 30 kPa, up to 250 kPa for the highest voltage range	-25 to 40 °C (indoor)	~1 kg
	Load break switches	3.6-52 kV	30 kPa	-25 to 40 °C (indoor)	~0.1 kg
	Circuit breaker	3.6-52 kV	250 - 500 kPa	-25 to 40 °C	~0.2 kg
	Auto-recloser	3.6-52 kV	30 kPa	-40 to 50 °C (outdoor)	~0.4 kg
HV	Gas-insulated switchgear	72.5 - 1200 kV	400 - 650 kPa	-30 (-50 °C with heating) to 40°C	30 - >1200 kg
	Circuit breakers (Live tank and Dead tank)	72.5 - 1200 kV	400 - 650 kPa	-30 to 40 °C	2 - >400 kg, various designs
	Gas-insulated lines	115 - 1200 kV	350 - 900 kPa at 20 °C (depending on voltage level and gas mixture)	-25 to 40 °C	5 - 30 kg/m, depending on voltage level
Mixtures	with SF6:				
SF6/N2	Circuit Breakers	72.5 - 735 kV	325 - 890 kPa	-50 to 40 °C	36-80 Vol% SF6 3 kg to 73 kg
	Gas-insulated lines	230 - 550 kV	340 - 930 kPa	-30 to 40 °C	20-60 Vol% SF <sub>6</sub> 3 - 6 kg/m
SF <sub>6</sub> /CF <sub>4</sub>	Circuit breakers	72.5 - 735 kV	600 - 900 kPa	-60 to 40 °C	25-52 Vol% SF <sub>6</sub> 1 - 83 kg

### Environmental concerns with SF<sub>6</sub> use Evolution of SF<sub>6</sub> concentration in the atmosphere

- Intensive measures to avoid SF<sub>6</sub> emission, since long time
- Nevertheless increasing SF<sub>6</sub> concentration in the air
- Review of worlwide regulations is given in the brochure

### Alternatives to SF<sub>6</sub> for electrical insulation

- Non-gaseous insulation: Solid, liquid and vacuum
- Insulation with gases of natural origin
- Synthetic gas, or gas mixtures alternatives
- Technical as well as non-technical requirements on gases are given in the brochure

# Example of estimation process for the choice of an SF<sub>6</sub> alternative mixture

### **Description of methods to find new gases**

- Screening methods by observing relations of microscopic molecule properties with electric strength and boiling point
  - Summary of studies from 1977 until 2019
  - Overview of descriptors used for the prediction of electric strength (ES) and boiling point (BP)
- Methods for filtering considering environmental and safety aspects
- Dedicated chemical engineering to find latest generation of insulation gases

### Methods to characterize gases

- Physical properties
  - Vapour pressure / Boiling points of pure substances
  - Equation of state and pressure-temperature curve for gases and mixtures (→ volume / molar concentration ≠ partial pressure filling)
  - Thermodynamic and transport properties (enthalpy, specific heat, thermal and electrical conductivity, speed of sound, viscosity)
- Chemical properties and stability
  - Thermal stability
  - Stability under permanent electric stress and partial discharge
  - Stability under X-ray irradiation
- Electron interactions with the gas
- Electric breakdown strength

### Gases selected in this working group

- SF<sub>6</sub>
- C4-FN mixtures (in CO<sub>2</sub>)
- C5-FK mixtures (in CO<sub>2</sub> and air)
- HFO-1234ze(E)
- CF<sub>3</sub>I (mixture)

Pre-Study for natural-origin gases (CIGRE WG D1.51): "Dry air, N<sub>2</sub>, CO<sub>2</sub> and N<sub>2</sub>/SF<sub>6</sub> mixtures for gas-insulated systems" TB 730 (2018)

### Summary of know-how on gases and gas mixtures

Property	C4-FN	C5-FK	Trifluoroiodomethane	Hydrofluoolefin 1234 zeE
Chemical formula	(CF <sub>3</sub> )₂CFCN	CF <sub>3</sub> C(O)CF(CF <sub>3</sub> ) <sub>2</sub>	CF₃I	C <sub>3</sub> H <sub>2</sub> F <sub>4</sub>
Boiling point (°C)	-4.7	26.9	-22.5	-19.4
Molar Mass (g/mol)	195.04	266.04	195.91	114.04
Relative electric	>200	~200	~119	~ 85
strength				
(% of SF <sub>6</sub> )				
Ozone depletion	0	0	Very low	0
potential (ODP)				
Global warming	2100 <sup>(1)</sup>	<1	0.4	<1
potential (GWP)				
Flammability	No	No	No	No according to ASTM
				E681-01 , to slightly
				according to ISO
				817:2014

(1): depending on the method applied for the calculation of the GWP, this value can vary from 1490 to 3646 [126] [127]

# Summary of know-how on gases and gas mixtures

Property	C4-FN	C5-FK	Trifluoroiodomethane	Hydrofluoolefin
		1		1234 262

### Summary on insulation strength related characteristics

# Part B

#### Newly proposed test methods and procedures

### **Practical Insulation Performance**

- Behaviour under non-ideal conditions
  - Non-uniform fields (weakly and strongly)
  - Electrode surface roughness
  - Electrode surface size
  - Partial-Discharge Inception
  - Impulse Voltage Waveshape
- determine applicable limiting values for a reliable design of industrial gas-insulated systems

### **Proposal for practical tests**

- electric strength for AC and transient voltages
- electric strength under weakly non-uniform electric fields
- sensitivity to electrode surface conditions and size (i.e. area effect)
- sensitivity to strongly non-uniform electric fields in the form of imperfections such as protrusions and particles
- relation between AC and LI breakdown strengths
- test conversion factors according to IEC 60071-1

### Definition of a representative test parameter set

	MV	HV
Typical gap distance	25 - 60 mm	30 – 100 mm *
Chosen reference gap distance	10 mm (±1%)	15 mm (±1%)

Weakly non-uniform arrangement	MV	HV
Typical degree of homogeneity	η = 0.15 – 0.5	η = 0.45 – 0.8

Strongly non-uniform	MV and HV
Sharp edges	η = 0.05-0.15
Protrusions	η = 0.01-0.05

	MV	HV
Typical surface quality	R <sub>t</sub> =15 – 50 μm	R <sub>t</sub> = 15 – 50 μm
Chosen reference surface quality	$R_{t} = 50 \ \mu m \ (\pm 2 \ \mu m)$	R <sub>t</sub> = 20 μm (±2 μm)

	MV	HV
Typical pressure (absolute)	0.12 - 0.16 MPa	0.5 - 0.8 MPa
Chosen reference (absolute)	0.13 MPa	0.6 MPa

### Definition of a representative test parameter set

	MV	HV
C4-FN	was not proposed for MV application	5% C4-FN / 5% O <sub>2</sub> / 90% CO <sub>2</sub>
C5-FK	13.5% C5-FK / 17.3 % O <sub>2</sub> / 69.2% N <sub>2</sub>	5.5 C5-FK / 11.2 % O <sub>2</sub> / 83.3% CO <sub>2</sub>
CF <sub>3</sub> I	30% CF <sub>3</sub> I / 70% CO <sub>2</sub>	30% CF <sub>3</sub> I / 70% CO <sub>2</sub>
HFO	100% HFO1234ze(E)	was not proposed for HV application

	Minimum Temperature	Reference
MV GIS indoor	-5°C	IEC 62271-200
MV GIS outdoor	-25°C	62271-200
HV GIS outdoor	-25 °C / -40°C	IEC 62271-203
HV GIS only indoor	-5 °C / -25°C	IEC 62271-203
HV AIS	-30 °C	IEC 62271-100
HV GIL (tunnel installation)	-10 °C	IEC 62271-204
HV Special application in cold	-50 °C	IEC 62271-1
countries		

### **Recommended tests**

#### (these were also performed within this working group)

Pre-study with AC: Mixture and pressure screening in homogenous arrangement

Test 1: AC withstand voltage test in weakly non-uniform arrangement

Test 2: Lightning impulse breakdown test in weakly non-uniform arrangement

Test 3: Lightning impulse breakdown test in strongly non-uniform arrangement

### **Recommended tests**

(these are recommended but were not performed within this working group)

- Test 4: AC breakdown test in strongly non-uniform arrangement
- Test 5: AC breakdown in weakly non-uniform arrangement with varying surface size
- Test 6: Switching impulse breakdown test in strongly non-uniform arrangement
- Test 7: AC breakdown test in uniform arrangement with varying surface roughness
- Test 8: LI breakdown test in uniform arrangement with varying surface roughness
- Test 9: PD activity in strongly non-uniform arrangement
- Test 10: PD measurement in quasi-uniform arrangement with particle on insulator
- Test 11: AC breakdown voltage after ageing of gas
- Test 12: Withstand voltage under VFT conditions
- Test 13: PD measurement with hopping particle attached to HV electrode
- Test 14: AC breakdown in uniform arrangement with insulator at varying humidity

### **Definition of protocol and measurement guidelines**

- Very detailed step-by-step documentation of
  - ✓ experimental setup
  - ✓ preparation procedure
  - ✓ experiment execution
  - ✓ documentation procedure
- Template for measurement protocol.

(all available for future use at https://doi.org/10.3929/ethz-b-000482801)

# Part C

#### **Electrical Insulation Strength of novel gas mixtures**

### **Overview**

«Part C: Electrical Insulation Strength of novel gas mixtures»

- Data Evaluation Methods and Example Results
- Test Data Analysis
  - SF<sub>6</sub>
  - C4-FN mixtures
  - C5-FK mixtures (in CO<sub>2</sub> and air)
  - HFO-1234ze(E)
  - CF<sub>3</sub>I (mixture)
- Summary & Conclusion (Part C)

### **Data Evaluation Methods**

AC voltage rise breakdown test

- Sort by breakdown voltage
- Median (incl. confidence interval)
- 16 and 84 percentiles (with 75% confidence)

[H. Schmid, IEEE Solid-State	Circuits Magazine	6(2), 52	(2014)]
------------------------------	-------------------	----------	---------

### **Data Evaluation Method Examples**

#### AC voltage rise breakdown test

Polarity: -

Median=46.5 kV
 75% confidence of median=46.4 & 46.6 kV
 15.87% & 84.13% with 75% confidence=45.5 & 47.8 kV
 Polarity: not given

- Good examples
- «conditioning» effect for first few shots may be present
- $\geq$  30 shots seems reasonable

# **Data Evaluation Method Examples**

#### AC voltage rise breakdown test

- «Bad» examples
- Decreasing or increasing trends
- Polarity despite uniform field not randomly distributed

### **Data Evaluation Methods**

#### LI voltage data evaluation

### **Data Evaluation Methods**

LI voltage data evaluation

### **Data Evaluation Examples**

#### LI voltage data evaluation

• Good examples

(even though starting value is very low)

### **Data Evaluation Examples**

#### LI voltage data evaluation

- «Bad» examples
- Typically increasing or decreasing trend

#### Fundamentals of Electric Breakdown in Strongly Attaching Gases

(as known from SF<sub>6</sub>, to be shown if also present in new gas mixtures)

- Initial electron (radiation ionization, detachment, cathode surface emission)
- Primary avalanche
- Secondary avalanches and Generation Mechanism
- Streamer Initiation
- Streamer Propagation
- Streamer-to-leader transition
- Leader Breakdown
  - The chosen test geometries and arrangements should allow to study all these different mechanism.

# **Results for SF<sub>6</sub>**

AC breakdown in uniform electric field (1 bar, 5 mm) (all data points, no need to reassess)

- SF<sub>6</sub> is well studied and used as reference gas
- Identify all basic breakdown processes
- Benchmark for inter-lab comparison
- Reasonable agreement in between labs
- $\sim 15 \%$  uncertainty
- Reasonable agreement to literature

### **Results for SF<sub>6</sub>**

(4)

- Even for  $SF_6$ , some test series had to be excluded from the evaluation.
- Inter-laboratory comparison shows significantly increased scatter.

### Results for "practical insulation performance MV" (left: all data, right: reassessed)

## **Results for SF6**

Results for "practical insulation performance HV" (only reassessed)

- Only few labs performed HV test with SF<sub>6</sub>.
  (dedicated gas handling equipment needed)
- Inter-laboratory comparison best for AC voltage
- Largest scatter for LI positive.

### Summary: SF<sub>6</sub> measurements

- Chosen geometries suited to test for all breakdown phenomena
- In general good inter-laboratory agreement.
- Even in SF<sub>6</sub> some measurement series shown trends and thus, measurements have to be carefully questioned always.
- Application of purging voltage between shots has significant influence (maybe even effect of different background radiation can be seen)

### **Results for C4-FN (mixtures)**

- Strong synergy, especially < 10 %
- With 20% similar to  $SF_6$

### **Results for C4-FN (mixtures)**

# Pressure scan of 5% C4-FN in CO<sub>2</sub> in uniform field. (reassessed data)

- Linear increase with pressure
- At 100 kPa approx. 65% of SF<sub>6</sub>
- With  $\sim 170$  kPa similar to SF<sub>6</sub> at 100 kPa

### **Results for C4-FN (mixtures)**

- In general good inter-laboratory comparability
- For LI similar behaviour as SF6
  - Weakly non-uniform:  $U_{LI+} > U_{LI-}$
  - Strongly non-uniform:  $U_{LI+} < U_{LI-}$

Practical Insulation Performance HV of C4-FN (reassessed data)

### **Summary: C4-FN measurements**

- breakdown voltages in the C4-FN mixture showed similar trends to those in SF<sub>6</sub>
- no unexpected effects were observed
- gas mixture can be considered self-restoring
  - Existing test and design rules, known from SF<sub>6</sub>, can be similarly applied to C4-FN mixtures when scaled with the ratio of electric strength.

### Results for C5-FK (mixtures in CO<sub>2</sub>)

- One lab consistently lower (no plausible reason found)
- Due to boiling point 100% not measureable
- Strong synergy, especially < 10 %</li>
- With 30% similar to SF<sub>6</sub>

### **Results for C5-FK (mixtures in CO2)**

- Breakdown field almost constant 100-300 kPa
- At 100 kPa approx. 55% of SF<sub>6</sub>

Pressure scan of 5.5% C5-FK in  $CO_2$  in uniform field. (reassessed data)

# **Results for C5-FK (mixtures in CO2)**

Practical Insulation Performance HV of C5-FK / CO<sub>2</sub> mixture (reassessed data)

- In general good inter-laboratory comparability (one exception)
- For LI similar behaviour as SF6
  - Weakly non-uniform: U<sub>LI+</sub> > U<sub>LI-</sub> (one exception)
  - Strongly non-uniform:  $U_{LI+} < U_{LI-}$

### **Results for C5-FK (mixtures in air)**

Mixing ratio scan of C5-FK in air at 100 kPa in uniform field. (reassessed data)

- Electric strength in air slightly higher than in  $CO_2$ .
- Strong synergy, especially < 10 %
- With  $\sim 30\%$  similar to SF<sub>6</sub>

## **Results for C5-FK (mixtures in air)**

- In general good inter-laboratory comparability
- Chosen gas mixture has ~70% withstand strength as SF<sub>6</sub>
- Effect of purging in between shots clearly visible for LI+

Practical Insulation Performance MV of C5-FK / air mixture (reassessed data)

### **Summary: C5-FK measurements**

- Breakdown voltages in the C5-FK mixture showed similar trends to those in SF<sub>6</sub>
- No unexpected effects were observed
- Gas mixture can be considered as self-restoring
  - Existing test and design rules, known from SF<sub>6</sub>, can be similarly applied to C5-FK mixtures when scaled with the ratio of electric strength.

### **Results for HFO 1234ze(E)**

- Empty markers show ((first)) breakdown
- Full markers are evaluation of full series •
- For some labs: large difference between  $\bullet$ first and consecutive breakdowns.
- Linear increase with pressure •
- At 100 kPa ~70-85% of SF<sub>6</sub> ۲

# **Results for HFO 1234ze(E)**

-Maximum = max(hold) = 92.7 kV

Strong degradation effects observable
 Non-self-restoring gas

# **Results for HFO 1234ze(E)**

- For AC good inter-laboratory comparability
- Large scatter for LI weakly non-uniform measurements
- Strongly non-uniform:  $U_{LI+} < U_{LI-}$
- Soot deposit in test vessels, strongly influencing LI+ tests

Practical Insulation Performance MV of HFO1234ze(E) (reassessed data)

## Summary: HFO 1234ze(E) measurements

 Gas decomposition occurs in all tests and is visible as "soot" on electrodes

(test circuits with strong energy input limitation are essential)

• Some tests strongly influenced by decomposition products, though not all gas mixture should be considered as non-self-restoring

Progressive test stress procedures more suited to test this gas.
 Gas suited for insulation purposes only
 Additional design margin required to prevent any flashover.

# **Results for CF<sub>3</sub>I**

 Gas shows strong decomposition and formation of sticky deposition layer on electrodes

(stronger at higher mixing ratios and pressure)

- One lab systematically above two others
- Many test series had to be excluded.
- No unambiguous conclusion can be derived.

Mixing ratio scan of CF3I in CO<sub>2</sub> at 100 kPa in uniform field. (left: all data, right: reassessed)

# **Results for CF<sub>3</sub>I**

- Again, many test series had to be excluded.
- No valid test series for weakly non-uniform LI+
- Best comparison for strongly non-uniform LI test
  - $U_{LI+} < U_{LI-}$
- > No unambiguous conclusion can be derived.

Practical Insulation Performance MV of  $CF_3I$  in  $CO_2$  (reassessed data)

## Summary: CF<sub>3</sub>I measurements

- Strong gas decomposition with sticky layers on electrodes observed.
- Gas mixture should be considered as non-self-restoring
- If considered for application: material compatibility tests should precede experimental campaigns.

 $\succ$  Test series proposed by WG D1.67 unsuitable to investigate this gas mixture.

# Part D

### **Gas Mixture Analysis**

### Round robin gas analysis campaign

- New gas mixtures contain small amounts (around 5%) of compounds that dominate the electric strength.
  - $\rightarrow$  accurate mixing and determination of mixing ratio important
- Round robin tests performed on 2 gas mixtures
  - ✓ Samples prepared centrally
  - ✓ Shipped in sample bottles
  - Analysed in (up to) 7 laboratories (gas chromatography –(mass spectroscopy), FTIR

# C4-FN / O<sub>2</sub> / CO<sub>2</sub> mixture (5% / 5% / 90%)

- Prepared with commercial mixing unit
- Composition measured with mobile analyser after mixing (5.07 %mol / 5.17 %mol / rest)
- Liquefied and transferred to 50l shipping bottle
- On distribution site: evaporated into 1000 I vessel and mixed (measured to be 5.3 %mol / 5.42 %mol / rest)
- Filled smaller sample bottles and transfer to labs

### C4-FN / O<sub>2</sub> / CO<sub>2</sub> mixture (5% / 5% / 90%)

- reported values from 5.23 %mol to 5.57 %mol (within mutual uncertainty)
- but above target value and measurement before liquefaction

# C5-FK / O<sub>2</sub> / CO<sub>2</sub> mixture (5.5% / 11.2% / 83.3%)

- Prepared with mass-flow controlled mixing device into large device
- Filled smaller sample bottles and transfer to labs

### C5-FK / O<sub>2</sub> / CO<sub>2</sub> mixture (5.5% / 11.2% / 83.3%)

- reported values from 4.84 %mol to 5.65 %mol
- four out of seven within mutual uncertainty and around target value
- three significantly below others and below target

### **Summary & Conclusion**

«Part D: Gas Mixture Analysis»

- Gas analysis with ± 0.2 % abs. neither trivial nor consistently achievable
- No single root cause for deviations determined. Could be:
  - Calibration (no traceable calibration gases available)
  - Different analysis methods
  - Sample preparation and shipping

### **Summary and Conclusions**

- Comprehensive summary of know-how about fluorinated non-SF<sub>6</sub> gases
- One of the largest round robin breakdown test series was performed with 14 laboratories contributing.
- A set of test series was defined that lays the basis for qualification of new gases and can be taken as a guideline for future gas assessment.
- The experiments were designed separately for high-voltage and medium-voltage applications.
- Mixtures were selected based on proposals from manufactures to represent typical mixtures in application. A direct comparison of the novel gases was not aimed for, but comparison is made versus SF<sub>6</sub> only.

**CIGRE Session 2022** 

### **Summary and Conclusions**

- Despite extreme care, intra- and inter-laboratory reproducibility and comparability was not always possible to achieve (sometimes even for SF<sub>6</sub>).
- C4-FN and C5-FK gas mixtures show the same principal discharge behavior as  $SF_6$  (self-restoring gases for pure insulation purposes).
- HFO1234ze(E) and CF<sub>3</sub>I are identified as non-self-restoring gases with degradation after breakdowns under the given conditions. An extra design margin is recommended to prevent flashovers during testing.
- A further round-robin test was conducted on gas analysis of C4-FN and C5-FK based gas mixtures
- Overall, an uncertainty of  $\pm 0.2\%$  abs. seems to be not easily achievable, even under laboratory conditions
